The ongoing US-Israel strikes on Iran escalating to gulf countries, has caused heightened geopolitical tensions in the entire West Asia region, driving uncertainty in the agri-business, besides other sectors of the economy. The instability in the Middle East has affected energy costs, production costs leading to increased price volatility. Additionally, higher tariffs and protectionism have caused shift in global trade routes. Such a challenging environment calls for a continuous process of judicious adaptations to newer ways of dealing with trade. Despite these headwinds, IOPEPC will continue to stay focused on the long-term goals contributing to the growth of the Oilseeds and Oils sectors.

In this context, it is pertinent to place on record our sincere appreciation for the steadfast support extended by Government institutions such as the Ministry of Commerce & Industry, the Directorate General of Foreign Trade (DGFT), the Export Credit Guarantee Corporation of India (ECGC), the Central Board of Indirect Taxes & Customs (CBIC), Reserve Bank of India and other allied agencies. Amidst prevailing

global uncertainties, their proactive policy measures, timely interventions, and continuous engagement with the exporting community have been instrumental in ensuring seamless trade facilitation and strengthening India's resilience in the global marketplace. Their collective efforts have played a significant role in sustaining and enhancing the country's export performance despite challenging conditions.

I am happy to announce that IOPEPC is gearing up to organise the Annual Capacity Building Programme and Trade Meet on 9th May 2026 in Rajkot, Gujarat, with a focused objective of strengthening the ecosystem of Groundnut, Sesame and other Oilseeds and enhancing India's export competitiveness. The event is marked by a conference where eminent speakers and industry experts will gather to deliberate on market trends, export opportunities, quality standards in Oilseed sector. The highlights of the event are the presentation of Rabi (Summer) Crop Survey 2026 estimates for Sesame and Groundnut and release of the Summer Groundnut and Sesame Crop Survey results. The surveys were conducted across the states of Gujarat, Maharashtra, Uttar Pradesh and West Bengal, through the independent survey agency.

It is interesting to note that the crop survey incorporated advanced technologies including remote sensing, Geographic Information System (GIS), and scientific modelling techniques to ensure accurate crop area assessment, acreage validation, and yield estimation.

We invite you to participate in this most prestigious Capacity Building Programme and Trade Meet to take benefit of the latest findings in the crop survey, which will enable participants to have a more informed decision-making process, in strengthening India's position on the global map of Groundnut and Sesame seeds.

In spite of the tensions prevailing in West Asia, India was able to maintain its Oilseeds export performance with respect to Sesame seeds, during the period April - February 2025 - 2026, recording a growth rate of 9.71% in quantity term, wherein 2,49,642.35 MT was exported, as compared to the same period in the previous year with 2,27,554.40 MT. The major importing countries were South Korea, Vietnam, China, Russia and USA.

Similarly, Groundnut exports during April - February 2025 - 2026 was 6,34,931.00 MT and the major importing countries were Indonesia, Vietnam, Malaysia, China and UAE.

As we move to the next financial year 2026-27, we remain committed to our efforts in consolidating the Council's position in facilitating engagement with the government, industry and all stakeholders in India's Oilseeds sector. We thank our exporters, farmers, policymakers who are part of this journey in strengthening India's position in the international Oilseeds trade, as they continue to look for new global opportunities.

Monthly Programs

IOPEPC Organises Trade Meet and Capacity Building Programme in Rajkot

The Indian Oilseeds and Produce Export Promotion Council (IOPEPC) is organizing a Trade Meet and Capacity Building Programme on 9th May 2026 in Rajkot, Gujarat, with a focused objective of strengthening the ecosystem of Groundnut, Sesame and Oilseeds and enhancing India's export competitiveness.

The event will present the Rabi (Summer) Crop Survey 2026 estimates for Sesame seeds and Groundnuts, along with unveiling the results of the Summer Groundnut and Sesame Crop Survey conducted across Gujarat, Maharashtra, Uttar Pradesh and West Bengal. The Trade Meet will feature a comprehensive conference covering key aspects such as market trends, export opportunities, quality standards and emerging developments in the Groundnut, Sesame, and Oilseeds sector. Eminent speakers and industry experts will share their insights, offering valuable perspectives to support stakeholders in making informed and strategic business decisions.

Overall, the initiative aims to provide stakeholders with the latest crop intelligence, market outlook, and strategic direction, reinforcing India's position as a key global supplier of Groundnut, Sesame and Oilseeds.

IOPEPC Undertakes Summer Crop Survey for Groundnut & Sesame across Key Producing States

As part of its continued commitment towards data-driven planning, the Indian Oilseeds and Produce Export Promotion Council (IOPEPC) undertook a comprehensive summer crop survey for Groundnut and Sesame during March–May 2026 across the states of Gujarat, Maharashtra, Uttar Pradesh, and West Bengal, through the independent agency RMSI Cropalytics Ltd. The survey aimed to assess key parameters such as acreage coverage, crop condition, growth stages, and yield outlook, which are critical for understanding the overall crop scenario.

The survey incorporated advanced technologies including Remote Sensing, Geographic Information System (GIS), and scientific modelling techniques to ensure accurate crop area assessment, acreage validation, and yield estimation. This technology-driven approach, combined with extensive field-level assessments across major cultivation districts, has enabled the generation of reliable and high-quality crop intelligence.

The findings of the survey are expected to support stakeholders with credible data for informed decision-making, facilitating better trade planning and strengthening India's position in the global Groundnut and Sesame sector.

JKT Global - Driving India's Rise in the Global Oilseeds Trade

Kanak Thakker,
Group Director, JKT Global

Led by Mr. Kanak Thakker, Group Director, JKT Global has evolved from a domestic agro-commodity supplier into a globally recognized enterprise. A second-generation entrepreneur, Mr. Thakker has steered the group's expansion across key international markets, with a presence in the Netherlands, United Kingdom, Dubai, Singapore, and India. The company is a leading processor and exporter of Sesame seeds, Groundnuts, and other agri-commodities. Under Mr. Thakker's leadership, the company has developed globally compliant processing facilities across Mumbai, Rajkot, and Chennai, in line with BRCGS and ISO 22000 standards. In this interview, Mr. Thakker shares his perspectives on key measures to enhance India's Oilseeds exports and strengthen its position in the global market.

How can India achieve self-reliance in the oilseeds sector?

India can achieve self-reliance in oilseeds through higher productivity, adoption of improved seed varieties, better irrigation coverage, and mechanisation. Strengthening farmer extension services, reducing post-harvest losses, and ensuring remunerative prices through MSP support will be critical to making Oilseed cultivation economically sustainable.

What has been the impact of the Export Promotion Mission (EPM) since 2025

Since its launch, the Export Promotion Mission has helped improve export facilitation, logistics coordination, and market access for agri-commodities. Going forward, EPM can further support the Oilseeds sector through branding, quality compliance support, and market intelligence, thereby improving India's global competitiveness and export growth.

How can India achieve a USD 30 billion Oilseeds exports by 2030?

The USD 30 billion target can be achieved through a combination of yield improvement, value addition, and expansion into high-value export markets. Investments in processing infrastructure, quality upgradation, traceability, and policy stability will help the Oilseeds and edible oils sector contribute meaningfully to India's economic goals.

What is the role of the National Mission on Edible Oils–Oilseeds?

The mission has played a positive role in encouraging Oilseeds cultivation and improving awareness of best farming practices. However, its long-term success will depend on effective execution at the ground level, availability of quality seeds, farmer profitability, and continuity of policy support.

What are the measures to increase exports of Groundnuts and Sesamum?

Along with quality improvement and market access, there is a strong need to create standardised specifications for Indian Groundnuts and Sesamum seeds.

Currently, trade is conducted based on varying specifications mutually agreed between buyers and sellers, which often leads to disputes and quality interpretation issues. A nationally accepted standard specification will bring uniformity, reduce disputes, increase transparency, and significantly strengthen India's credibility as a reliable exporting origin.

How effectiveness has bilateral trade agreements been for the Oilseeds sector?

Bilateral agreements with countries such as the UAE, Australia, Mauritius, and EFTA nations have been clearly helpful, especially for Groundnuts and Sesamum seeds. We are witnessing a consistent year-on-year increase in export volumes to these destinations. Reduced tariff barriers and improved trade facilitation have supported sustainable export growth.

How can India reduce import dependency and achieve self-sufficiency in Oilseeds?

A balanced policy approach is crucial. At times, government policies focus on consumers by allowing cheaper imports, while at other times they prioritise farmer interests to avoid distress sales.

If the MSP programme is strengthened and implemented consistently, it will encourage farmers to expand Oilseeds cultivation. A long-term policy balance between consumer affordability and farmer income security is key to reducing import dependency.

What are the steps taken to reduce aflatoxin and salmonella?

We have built a strong QA and QC ecosystem backed by continuous investment in advanced technologies such as colour sorters, laser sorters, X-ray machines, metal separators, and an in-house laboratory.

Additionally, our extension team works closely at the farm level to study agronomic factors and provide guidance to farmers. This enables us to shortlist procurement areas effectively, which has significantly helped mitigate risks related to aflatoxin in Groundnuts and salmonella in Sesamum seeds.

What are your company plans for expansion into newer markets?

Our expansion strategy focuses on entering regulated and premium markets where quality, compliance, and traceability are valued. Alongside strengthening our

presence in existing markets, we are selectively exploring new regions that align with our long-term quality-driven approach.

How has your company handled consignment rejections due to quality issues?

We handle quality rejections in a structured and disciplined manner through a complete Corrective Action Preventive Action (CAPA) process. This includes detailed root-cause analysis, immediate correction, corrective action, and preventive measures.

The objective is not only to resolve the current issue but also to minimise future rejections for similar problems by strengthening systems and controls.

What is the impact of the US-Israel strikes on Iran conflict on Gulf business?

The situation has had a significant impact. Freight rates are elevated, shipping lines are imposing multiple surcharges, and Global Reporting Initiative (GRIs) are being announced due to rising crude prices.

Insurance availability has become challenging, inflation is increasing, and overall costs are rising sharply. For exporters, this acts like a double-edged sword, severely impacting margins and business sustainability.

What are the market-preferred traits across key destinations?

Market preferences vary by region. European markets prioritise food safety, traceability, and low contaminants, while African and Asian markets focus on consistency, size, colour, oil content, and price competitiveness. Understanding and catering to these market-specific requirements is essential for long-term success.

What is your message to the exporting community?

Exporters should avoid working on very low margins and open credit terms. In today's uncertain global environment, risks such as buyer defaults, insurance premium hikes, freight volatility, exchange-rate fluctuations, and geopolitical disruptions are very high.

These risks can quickly wipe out even a strong balance sheet. Strict risk-management practices, disciplined credit policies, and a focus on sustainable profitability are essential. ●

Strengthening India's Groundnut Exports through Quality, Innovation, and Farmer Partnerships

India's Groundnut journey doesn't begin in export containers or processing units-it begins in the fields of Gujarat, especially in the dry belt of Saurashtra, where farmers have been cultivating Groundnuts for generations. Here, groundnut is not just a crop- it is a cycle of trust between soil, farmer, and market. Over the years, this region has quietly powered India's position as one of the world's leading Groundnut exporters.

From these farms, Groundnut travel thousands of kilometers to reach consumers across Thailand, Vietnam, Malaysia, Ukraine, and Turkey. Exports start with these very farms, steadily building into markets like Thailand, while also exploring opportunities in Ukraine, Iraq, and Russia.

What one learns from international trade is simple — buyers may negotiate on price, but they never compromise on quality and consistency. And this is where the real challenge begins.

At the ground level, one of the most overlooked issues is seed purity. In many cases, farmers still use mixed or recycled seed varieties like G20-type seeds. While these may work for local markets, they create inconsistency in kernel size, oil content, and appearance-factors that matter a lot in export markets. A buyer in Thailand, Europe, Russia, Ukraine does not just want Groundnuts; they want uniformity in every shipment, every time.

Then comes the bigger concern-aflatoxin. Something as basic as improper drying or delayed harvesting can lead to contamination, and once that happens, the entire value chain suffers. There are cases where shipments get rejected not because the product was bad, but because the process was not controlled properly at the farm level.

Globally, countries like Argentina and the United States have built strong systems around quality control and mechanized farming. Even African countries are now emerging with better structured supply chains. Competing with them means one cannot rely only on production strength-one has to build reliability.

This realization is slowly changing how the Indian Groundnut sector operates. One of the most encouraging developments in this direction is the introduction of

improved varieties like Ginar 4 (Girnar-4), developed by the Indian Council of Agricultural Research in collaboration with the International Crops Research Institute for the Semi-Arid Tropics.

From an exporter's perspective, Ginar-4 is not just another variety-it solves multiple problems at once. The kernels are bold, uniform, and visually appealing, making them ideal for premium markets. Its oil content is strong, around 48-50%, and more importantly, it features a high oleic profile that significantly improves shelf life and taste stability.

High-oleic Indian varieties like Girnar-4 contain around 78-80% oleic acid in their oil, compared to the 40-50% typically found in conventional Groundnuts. This higher oleic content enhances oxidation resistance, ensuring longer storage life and consistent quality-an important advantage for export markets like Thailand, where reliability and uniformity are critical

It is important to gradually align the sourcing strategy towards such improved varieties. But the quality cannot be achieved only by changing seeds -it has to be built step by step, starting from the farm.

By **Mr Sarthak Kagrana**
Founder - Kagrana Agri Export

Following the revised guidelines issued by Agricultural and Processed Food Products Export Development Authority (APEDA), focus is now strongly on backward traceability. It is advisable to work towards building a reliable farmer network where each lot can be traced back to its origin.

This involves working closely with farmers-ensuring they get access to better quality seeds, guiding them on Good Agricultural Practices, and most importantly, creating awareness about critical factors like harvesting time and moisture control. Something as small as reducing moisture at the right stage can significantly lower aflatoxin risk.

Conducting farm-level sensitization is crucial because in exports, quality is not created at the processing plant-it is protected from the field itself.

On the processing side, maintaining strict adherence to Good Hygienic Practices (GHP) and Good Manufacturing Practices (GMP) is to be followed. Currently, the trend is towards raw Groundnuts, blanched Groundnuts and gradually expanding into retail and value-added segments such as flavored Groundnuts.

This is where the next big opportunity unfolds

Globally, consumption patterns are changing. There is rising demand for ready-to-eat snacks, plant-based protein, and healthier food alternatives. Groundnut-based products like flavored Groundnuts and Groundnut protein powder are gaining traction, especially in vegan and health-conscious markets.

In regions like Africa, Groundnut-based protein products also hold strong potential as affordable nutrition solutions to address malnutrition. This opens a completely new dimension for Indian exporters—not just as suppliers of raw commodities, but as providers of value-added, functional food products.

It is the need of the hour that the next phase of growth is diversification. With the strength in sourcing and farmer connectivity, building a foundation where quality raw material can support a range of processed and innovative products in the future is of utmost importance.

In line with this, focus is on backward integration to ensure consistent quality in Groundnuts. There are plans for implementing contract farming initiatives, working closely with farmers to promote best agricultural practices, improve traceability, and ensure a reliable supply of premium-grade produce. This creates a win-win situation for both the company and farming partners.

Because in the end, exports are not just about sending goods abroad—they are about building trust, shipment after shipment.

India already has the advantage of scale and production. The next step is to strengthen quality systems, improve traceability, and invest in innovation. If the balance is right, there is no reason why India cannot lead not just in quantity, but in quality-driven Groundnut exports.

The journey has just begun. But one thing is clear - the future of the Groundnut industry belongs to those who can connect the farmer to the global market with consistency, transparency and trust.

Global Freight Market Update:

Ocean and Air Freight Trends - Market Analysis

Key Takeaways

- Ocean freight rates increased on major Asia–US routes despite weak seasonal demand.
- Air freight rates showed mixed trends, with some corrections after earlier increases.
- Geopolitical tensions near the Strait of Hormuz continue to influence freight costs.
- Fuel availability concerns may put further pressure on shipping and air cargo rates.
- Capacity adjustments by carriers are helping stabilize the market.

Ocean Freight Market Trends

According to the Freightos Baltic Index (FBX), ocean freight rates increased across major trade lanes. Asia–US West Coast rates rose by 11%, while Asia–US East Coast rates increased by 5%. Asia–Northern Europe rates increased by 2%, while Asia–Mediterranean rates declined by 2%.

Under normal circumstances, freight rates typically soften during this period between Lunar New Year and the peak shipping season. However, geopolitical tensions and fuel-related challenges have prevented the usual seasonal decline.

Transpacific container rates to the US West Coast have increased nearly 40% since the beginning of the conflict, reaching levels above \$2,400 per FEU. Similarly, Asia–Northern Europe rates increased by about 20% to approximately \$2,900 per FEU.

Key Rate Drivers – Ocean Freight

The main factors influencing ocean freight rates include:

- Rising bunker fuel costs
- Limited fuel availability at major refueling hubs
- Geopolitical risks affecting shipping routes
- Capacity management by shipping lines
- Supply-demand imbalances

Singapore, the world's largest bunkering hub, is reportedly facing tightening fuel supplies, while Rotterdam remains relatively stable. If fuel shortages continue, carriers may adopt slow steaming strategies or blank sailings to conserve fuel, potentially increasing freight costs further.

Air Freight Market Trends

Air freight markets showed mixed movements. China–North America rates declined by 16%, while

China–Northern Europe rates remained stable. Northern Europe–North America rates decreased by 3%.

Despite these declines, rates remain elevated compared to pre-conflict levels. South Asia–Europe rates remain about 62% higher, while Southeast Asia–Europe rates are approximately 33% higher than pre-conflict levels, reflecting ongoing capacity constraints and fuel cost pressures.

Key Rate Drivers – Air Freight

Major factors affecting air cargo rates include:

- Rising jet fuel costs
- Capacity shortages due to operational disruptions
- Gradual recovery of Gulf carrier operations
- Route diversions due to geopolitical risks
- Fuel conservation measures by airlines

Some operational disruptions have already been observed. Vietnam has cancelled certain domestic flights to conserve fuel, while refuelling restrictions have been reported in parts of Asia.

Gulf carriers are gradually restoring cargo capacity. Emirates SkyCargo is operating at approximately 60% capacity, Etihad Airways at 40%, and Qatar Airways Cargo at about 20% of their normal schedules.

Risk Factors to Watch

Key risks that may impact freight markets in the coming months include:

- Prolonged geopolitical tensions
- Fuel supply disruptions
- Carrier capacity adjustments
- Changes in global trade demand
- Regulatory decisions affecting freight pricing

Market Outlook

The near-term outlook for global freight markets remains uncertain. Ocean freight rates may remain firm if fuel supply challenges persist, while air freight rates may stabilize as additional capacity returns to the market.

Overall, freight markets are expected to remain sensitive to geopolitical developments, energy costs, and supply chain adjustments. Businesses may need to plan for continued rate volatility and potential disruptions in global logistics. •

International news on Oilseeds and Oils

Brazil sets new records as Global Soybean leader amid US-China trade tensions

With the 2025-26 harvest entering its final stages, Brazil is poised to further cement its status as the leading player in the global soybean market, achieving record shares in both production and exports this year.

The significance of Brazilian soybeans is heightened by ongoing trade tensions between the US - the world's second-largest exporter - and China, the largest global buyer of the commodity.

According to analysts at S&P Global Energy CERA, Brazil is expected to produce a historic 182 million metric tons of soybeans in 2025-26, accounting for 42.2% of global output -- a record share. Ten years ago, Brazil's share was just 30.3%.

On the export front, CERA analysts project shipments will reach 112 million mt in 2025-26, representing 59.2% of global soybean trade. This figure virtually matches the share seen in the 2022-23 cycle and compares to 38.8% a decade ago.

Soybean cultivation in Brazil accelerated in the 2000s, driven primarily by China's appetite for the crop. Growing domestic demand for soybean oil in the biodiesel industry and vast available farmland also contributed to this expansion.

In 2025-26, Brazil's soybean acreage reached nearly 50 million hectares, with 64% harvested as of March 18, according to CERA analysts.

While Brazil's dominance in the global soybean market has grown, the US has seen its share decline, though it remains a significant player.

CERA analysts expect US soybean production to total 116 million mt in 2025-26, representing 26.9% of global output - a drop from 33.8% in 2015-16.

A similar trend is seen in US soybean exports, which are projected to reach 42.9 million mt in 2025-26, or 22.6% of global exports. Ten years ago, the US share was 39.8%.

Brazil surpassed the US as the world's top soybean producer in the 2017-18 season. In terms of exports, Brazil has led since 2012-13.

This shift in the global soybean market, with Brazil increasingly established as the leader, has had a direct impact on commodity prices.

The correlation between Brazilian and US soybean prices has steadily decreased, reaching its lowest level in 2025 amid the ongoing US-China tariff dispute.

On March 24, Platts assessed the price of Brazilian soybeans FOB Santos for shipment in May at \$431.39/mt, up 6.5% year over year. Meanwhile, US soybeans FOB New Orleans for loading in May were valued at \$456.72/mt, up 13.8% year over year.

Source - S&P Global

Increase in US Soybean Oil inventories to record levels has sent its prices down

As a result of the tariffs imposed by Trump, soybean exports from the US in the first half of the MY 2025/26 decreased by 11.4 million tons compared to the previous season, which led to increased soybean processing and an increase in domestic prices for soybean oil.

According to estimates by the Oil World agency (Germany), in the 2025/26 MY, the volume of soybean processing in the US could reach a record 71 million tons, which would significantly exceed the 66.5 million tons in the 2024/25 season.

According to NOPA, soybean processing volumes in February decreased by 6% compared to January but amounted to a record for the month 208.8 million bushels. The decrease is due solely to the fewer days in February, as daily processing volumes increased compared to January from 7.15 to a record 7.45 million bushels/day (6.35 million bushels/day in February 2025).

In total, 36.3 million tons of soybeans were processed in the US in September-February MY 2025/26 (33.5 million tons for the same period in MY 2024/25 and 31.2 million tons on average over 5 years).

Due to record production volumes and low demand from the biofuel industry, soybean oil stocks in the US rose in February to their highest level since May 2018 (+39% year-on-year) and exceeded the February 2025 level by 5-6 million tons.

Initially, quotes were supported by hopes that the Trump

administration would increase biodiesel quotas and reduce subsidies for biodiesel made from imported oils by 50%, which has boosted demand for soybean oil. Recently, quotes have been rising in line with oil prices, despite rising oil inventories. In addition, Argentina and Brazil are increasing their soybean oil supply as their soybean harvests mature, and it is currently trading at \$1,150-1,220/t FOB.

As previously reported, soybean meal production in the USA, Argentina and Brazil (the top 3 producing countries) in the 2025/26 MY will increase by 1.8 million tons compared to the previous season to 68.9 million tons. ●

Source - UkrAgroConsult

Ukraine could boost Rapeseed plantings if Iran conflict drags on

Ukraine could boost rapeseed plantings by a third to 1.5 million hectares if the conflict in Iran drags on, as soaring global fuel prices lift demand for biodiesel feedstocks.

Fuel prices have surged since U.S.-Israeli strikes on Iran on February 28 sparked conflict in the Middle East, raising concerns of further increases if the war persists.

Ukraine is a major European producer and exporter of rapeseed, bought largely by EU countries for cooking oil and biodiesel.

An additional 400,000 hectares could yield at least 1 million metric tons of rapeseed. Ukraine grows winter rapeseed, sown in autumn and harvested in mid-summer the following year.

Agricultural consultancy APK-Inform has said Ukraine is likely to harvest 3.8 million tons of rapeseed in 2026, up from 3.3 million tons in 2025, with exports seen reaching 2.7 million tons in the 2026/27 July-June season. ●

Spotlighting Women in Oilseeds Sector

The United Nations has declared 2026 to be the International Year of the Woman Farmer (IYWF 2026). With respect to India, IYWF 2026 highlights the critical role of Indian women in the Oilseeds sector – from cultivation, to processing, and trade, addressing gender gaps issues in land ownership and market access. Women are also in post-harvest management, oil extraction, and with the help of Self-Help Groups (SHGs), participate in the value chain.

Women's Contribution to Oilseed Trade

- **Participation in the Value Chain Process:** Women play a major role in cultivation, harvesting, drying, and traditional oil extraction processes mainly seen in groundnut, mustard and soyabean.
- **Integration between SHG and Farmer Producer Organisation (FPO):** Women's collectives and FPOs together enhance bargaining power, provide market access and reduce dependence on middlemen.
- **Technology Adoption:** Initiatives like the Namo

Drone Didi Programme (Provides 15,000 drones to women SHGs with 80% central assistance to modernize farming and create new service-based livelihoods) – this enabled women to use modern technology for pest management in oilseed cultivation.

- **Government Support:** The Mahila Kisan Sashaktikaran Pariyojana (MKSP) – A programme empowering women in agriculture through skill development. The program supports women in sustainable farming, while Agriculture Infrastructure Fund (AIF) provides financial support for establishing small-scale processing units.

Aligning with IYWF 2026: The Global Conference on Women in Agri-Food Systems (GCWAS-2026) in New Delhi which emphasised strengthening women-led enterprises to bridge the gender gap in agricultural income and enhance their role in Agri-food supply chains.

Source: PIB

The import of Oilseeds into the EU has dropped by 17%: analysis of the 2025/2026 season from the European Commission.

The countries of the European Union increased imports of oilseeds to 12.8 million tons for the current season, which is 17% less than last year. The main suppliers are the USA and Brazil (soybeans), Ukraine (rapeseed), Moldova (sunflower). Sunflower imports grew by 17%, while rapeseed decreased by 33%.

In the current season, which has passed through thirty-eight weeks, the countries of the European Union increased the volume of oilseed imports to 12.8 million tonnes, which is 17% less than in the same period of the

previous season. This information was reported by the Grain Online agency, referring to data provided by the European Commission.

The largest suppliers of soybeans to the EU during the period under consideration are the United States (4.2 million tonnes) and Brazil (2.8 million tonnes). Rapeseed, in turn, was mainly supplied from Ukraine (1.2 million t), and sunflower seeds from Moldova (0.3 million tonnes). ●

Global Sunflower production to hit record highs

Global sunflower seeds production in the upcoming 2026/27 season could reach a record 62-63 million tonnes, significantly exceeding the 56.9 million tonnes in the current season and the previous record of 59.4 million tonnes in 2023/24. These figures are presented in a report on forecasts for the crop by the consulting agency Oil World (Germany). These figures can only be achieved under normal weather conditions, experts note.

The agency notes that farmers in many countries are partially abandoning the cultivation of corn and other crops that require significant amounts of fertilizer in favor of sunflower and soybeans. Therefore, global sunflower acreage in 2026/27 could increase to a record high of 34.1

million hectares, compared to 32.8 million hectares in the previous season.

Specifically, sunflower acreage in the EU is expected to increase by 0.2 million hectares this spring, reaching 4.9 million hectares, with the largest increases forecast for France, Hungary, Bulgaria, and Spain. This could boost sunseed production in the EU to 9.6-9.7 million tonnes, approximately 1 million tonnes more than last year's harvest.

The largest increases in sunseed production next season are expected in Russia and Ukraine, reaching 20-21 million tonnes and 12.5-13 million tonnes, respectively. ●

Domestic news on Oilseeds and Oils

Exports of Rapeseed and Soybean from India are declining

India is actively harvesting rapeseed, with the 2026 harvest expected to reach a record 11.7 million tonnes. However, the increased production will be largely offset by low inventories of the old crop, according to Oil World (Germany).

Analysts predict a slowdown in rapeseed processing in India in the 2026/27 season. After several years of rapid growth, the industry may face stagnation. Experts cite limited domestic supply and changing global oilseed market conditions as the main reasons.

Currently, rapeseed consumption within India is directly dependent on vegetable oil demand. However, the profitability of processing plants is under threat. Interest from foreign buyers is expected to decline in the coming months, as a new agreement between China and Canada could significantly reduce the share of Indian meal in the

Chinese market.

In October–January 2025/26, Indian rapeseed meal exports, according to analysts, already fell by 32% (to 356,000 tonnes), as prices for local products proved uncompetitive.

The Indian soybean sector is also experiencing stagnation. Soybean meal exports fell by 30% from October to January 2025/26, reaching only 425,000 tonnes.

Indian products are trading significantly higher than their global counterparts, and demand from European importers is sharply declining. The conflict in the Middle East has triggered rising freight costs and disruptions in supply chains, experts note.

Groundnut Prices Ease in Rajkot Amid Weak Demand

Groundnut prices remained under pressure during the week due to subdued demand trends. In Rajkot, Groundnut Bold average prices declined by 1.3% to INR 6,463 per quintal, weighed down by lower-quality

arrivals. Prices traded within a wide range of INR 5,300–7,625 per quintal, reflecting weak market sentiment.

Source - Agri-Watch

India rushes to secure prompt vegetable oil shipments amid price surge

Indian edible oil buyers are increasingly opting for prompt shipments as rising global prices and freight rates raise concerns about potential delivery delays linked to the conflict in the Middle East, according to market participants. The uncertainty is pushing importers to prioritize faster deliveries of soyoil and sunflower oil.

Local edible oil prices in India have recently surged in line with global markets, but refiners remain cautious about making new overseas purchases at elevated price levels. Traders say buyers are unsure whether current prices will hold and are also worried about possible shipping disruptions.

India, the world's largest importer of vegetable oils, mainly sources soyoil from Argentina and Brazil, while sunflower oil is largely imported from Russia and Ukraine. Shipments from South America typically take more than six weeks to reach India, while cargoes from the Black Sea region usually arrive within three to four weeks.

Market participants warn that a further escalation of tensions in the Middle East could force sunflower oil shipments from the Black Sea to bypass the Red Sea and

sail around Africa. Such a diversion would extend transit times by more than 10 days and increase freight costs by at least \$20 per ton.

At the same time, India continues to import palm oil from Indonesia, Malaysia and Thailand, with deliveries usually arriving within about a week. In February, the country's palm oil imports rose by 10.1% to a six-month high.

However, traders say many buyers are currently relying on previously purchased inventories bought at lower prices and are waiting for a correction in global markets, as recent price increases have pushed refining margins into negative territory.

Further development of the grain and oilseed markets of Ukraine and the Black Sea region will be in the spotlight of the BLACK SEA GRAIN. KYIV conference, taking place on April 22–23 in Kyiv. The event will focus on strategic directions for the agricultural sector through 2030, including investments, energy independence, processing, and exports of high-value products. ●

Domestic Sesame production expected to be around last year's level

India's domestic Sesame production for the 2025–26 season is expected to remain around last year's levels, indicating a stable output trend despite seasonal variations. Sesame in India is mainly grown across Kharif, Rabi, and Zaid (summer) seasons, with Kharif and summer contributing the largest share, while Rabi production remains relatively small.

According to official estimates, total Sesame production stood at about 8.93 lakh tonnes in 2024–25, and overall output has consistently remained within the 8–9 lakh tonnes range in recent years. For the current season,

early estimates show lower Kharif and Rabi output so far, but the final production figure will depend on the Zaid crop, which is harvested between May and June.

The area under summer Sesame cultivation is reported to be largely unchanged compared to last year, suggesting stable farmer interest in the crop.

Overall, the outlook indicates a steady production scenario, with no major increase or decline expected, keeping supply relatively balanced in the domestic market. ●

Edible Oil Prices Rise in India Amid Global Disruptions

Edible oil prices have risen by 11-20 per kg in March, with Sunflower oil recording the sharpest increase of 20 per kg and palm oil seeing the least rise at 11 per kg, according to distributors.

India consumes approximately 20 lakh tonnes of edible oil every month, with imports accounting for 60% of total supply.

The country's heavy dependence on imported Edible Oils makes domestic prices particularly sensitive to global supply disruptions and currency movements.

The price increase adds to the broader inflationary pressure Indian households are already facing from rising fuel and cooking gas costs. ●

Source - NDTV Profit

India cancels more soyabean oil shipments

At the time of the 4 March report, cancelled orders included shipments of around 25,000 tonnes from Russia and 6,000-8,000 tonnes from South America, according to sources.

The Russian cargoes had been scheduled to arrive in India by late March or early April, while the South American shipments had been due in the April to

July period.

In the week before the report, India had also cancelled about 70,000 tonnes of South American soyabean oil and had backed out of at least 35,000 tonnes in January as the rupee's slump had increased the cost of imports.

In addition, buyers had cancelled or delayed more than 100,000 tonnes of Argentinian shipments in December.

Soyabean oil has been trading at a premium to palm oil since 2023, according to the report.

Palm oil is a cheaper option for buyers looking for replacements.

The market had also been impacted after US attacks on Iran disrupted energy supplies from the Middle East, lifting prices as biodiesel demand increased, the report said.

Agriculture Minister approves proposals for procuring record quantities of Pulses, Oilseeds during Rabi 2025-26 season

Agriculture and Farmers' Welfare Minister Shivraj Singh Chouhan has approved proposals from the state governments for procuring record quantities of pulses and oilseeds during the Rabi 2025-26 season at Minimum Support Price (MSP) in Haryana, Uttar Pradesh, and Karnataka.

The Ministry of Agriculture and Farmers Welfare said that this procurement will be carried out under the Price Support Scheme (PSS) and will provide relief to farmers from the compulsion of selling their crops at throwaway prices. It added that through the approved PSS proposals for Haryana, Uttar Pradesh, and Karnataka, scientific and well-managed procurement at MSP of important

pulse and oilseed crops like gram, masoor, mustard, and kusum (safflower) will be ensured.

The total value of the approved procurement stands at more than 11,698 crore rupees, aimed at ensuring remunerative prices to farmers and preventing distress sale of produce. The Ministry said the move will benefit lakhs of farmers across the three states by ensuring fair prices for key pulses and oilseed crops, while strengthening food and nutritional security in the country.

Qualitek Labs Limited

About Us

Qualitek Labs Limited and Interstellar Testing Centre Pvt. Ltd. (ITC Labs), with 38+ years of combined experience, are trusted analytical testing laboratories serving the agri-export and food processing industry. Our expertise in oilseeds, edible oils, groundnuts, sesame, and agricultural commodities helps exporters meet global compliance requirements with confidence and reliability.

Testing & Analytical Services

We provide a comprehensive range of testing and analytical services covering the complete export value chain:

Food & Agricultural Testing

- Groundnuts, Sesame seeds, Oilseeds
- Edible oils & oil cakes

Chemical Analysis

- Pesticide residue analysis
- Mycotoxins & contaminants
- Heavy metals & chemical parameters

Microbiological Testing

- Pathogen testing including Salmonella
- Hygiene & food safety parameters

Export Compliance Testing

- Buyer-specific & country-specific standards
- Pre-shipment & batch testing

Sampling Services

- IOPEPC approved sampling
- Sampling as per prescribed protocols

Our Services – ITC Labs & Qualitek Labs

Testing | Inspection
Certification | Training

Accreditation & Membership

- NABL
(ISO 17025: TC-15730, TC- 16608)
- APEDA
- EIC
- IOPEPC
(IOPEPC/AM-13/2025-26, IOPEPC/
AM-151/2025-26)
- FSSAI
- Agmark
- BIS

Quality Services – Our Strength

- On-time Turnaround Time (TAT)
- Advanced testing methodologies (ViDAS, PCR & validate analytical techniques)
- Participation in Proficiency Testing (PT) programs
- Qualified technical professionals & strict internal QC
- Reliable, reproducible & export-ready reports

IOPEPC Approved Laboratories

Our laboratories are listed on the IOPEPC approved laboratories list.

IOPEPC Scope – Key Analysis

- Pesticide Residue Analysis as per IOPEPC export requirements
- Salmonella Analysis critical for food safety & export compliance
- Testing aligned with importing country norms & buyer specifications

IOPEPC Approved Samplers

15+ IOPEPC Approved Samplers

- Trained & authorized professionals
- Ensuring sample integrity, traceability & compliance
- End-to-end support from sampling to reporting

Health Benefits – Key Highlights

- Rich in Nutrients: Mustard seeds contain essential minerals like calcium, iron, magnesium and phosphorus which support bone health and metabolism.
- Heart Health Support: Presence of Omega-3 fatty acids and healthy oils help maintain cardiovascular health when consumed as part of a balanced diet.
- Natural Antioxidants: Contains antioxidants and plant compounds that help reduce oxidative stress and support immunity.
- Improves Digestion: Traditionally used in tempering to stimulate digestive enzymes and improve gut health.
- Anti-inflammatory Properties: Natural compounds present in mustard may help reduce inflammation.
- Supports Skin & Hair Health: Mustard oil is traditionally used for skin care and hair nourishment.
- Metabolism Booster: Mustard seeds contain compounds that may help improve metabolic activity.

Mustard Seeds - India's Golden Oilseed Crop

Planted Area:
8656839.6 Ha

Production:
12667105.08 Tons

Yield:
1463 Kg/Ha

Importing Countries: 127

Exports:
25,294,891 Tons

Imports:
2,501,969 Tons

Mustard seeds, though tiny in size, hold immense importance in India's agricultural and culinary landscape. As one of the country's major rabi oilseed crops, mustard plays a vital role in the edible oil economy and supports the livelihoods of thousands of farmers. Known for their distinctive pungent aroma and high oil content (30–40%), these seeds are an integral part of Indian kitchens as well as the global spice trade.

Indian mustard (*Brassica juncea*), commonly available in brown and black varieties, is a key ingredient in Indian cuisine, particularly used for tempering (tadka) to enhance flavour and aroma. Beyond their culinary importance, mustard seeds are valued for their nutritional richness. They are a good source of essential minerals such as calcium, iron, magnesium and phosphorus, along with antioxidants and healthy fats, including Omega-3 fatty acids, which contribute to heart health and overall well-being. The presence of nutrients such as selenium also

supports digestion and makes mustard an important ingredient in traditional Ayurvedic preparations.

Mustard oil remains a preferred cooking medium in many parts of eastern and northern India, while mustard cake, a by-product of oil extraction, is used as cattle feed and organic manure, reflecting the crop's sustainable value chain.

Mustard is harvested when the pods turn yellow and the seeds, typically measuring 1–2 mm in size, are separated from the husk. Mustard is one of the major Oilseed crops globally and ranks among the important sources of vegetable oil and protein meal.

As one of the leading producers of mustard globally, India continues to strengthen its position in the Oilseed sector through increased production, value addition and expanding trade opportunities, meeting both domestic consumption needs and growing export demand in regions such as the Middle East, the United States and Southeast Asia.

As an Agro Commodity

The mustard seed is the third leading source of vegetable oils, with soyabean and palm oil grabbing the second and first positions respectively. It also takes the second position as a source of protein after soybean meal, making it an important Oilseed crop for edible oil and animal feed industries.

Salient features and market Trends

- India is the major player with Rajasthan being the 'Mustard Bowl' of India. The other largest global players are Canada, Nepal and Russia.
- The mustard seed is a rabi crop sown in October - November and harvested during February – March.
- The market for mustard seeds is driven by demand-supply of edible oils.
- The mustard seed comes in several types - yellow mustard (mild, lower oil), brown/Indian mustard (spicy, higher oil), and oriental mustard.
- The mustard seed can be put to several uses - In the condiment industry, as a paste; in mustard oil extraction, for cooking; as protein-rich meal for cattle/poultry, and for bio fumigation in agriculture.

Trading with the Mustard

The mustard seed is cultivated not just in Rajasthan, but in Haryana, Madhya Pradesh, and Gujarat. It is globally imported by Canada and Australia. Pricing depends on the Rabi planting season, monsoon progress and substitutes like soybean and palm oil. Tightening mustard seed supply coupled by high demand for mustard oil can create a bullish price trend. The traded mustard seed requires low moisture approximately 12–15 per cent for harvesting with low foreign matter and strict quality inspections.

The mustard seed commonly referred to as RMSeed is traded on commodity exchanges both in the physical and futures markets such as National Commodity & Derivatives Exchange (NCDEX), which serves as a vital platform where price hedging for farmers and processors is carried out. It is critical for traders in agri-commodities

as it is not only essential in the food processing industry but also finds application in industrial oils.

There are opportunities for cold pressed or wood pressed mustard oil extraction, exports of mustard powder, whole grain mustard and usage in sauces.

The mustard seed is impacted by excessive rain and high temperatures during flowering.

As a result of its high nutritional value, the mustard seed is the preferred choice from among alternative edible oils, giving a major impetus to the market for premium quality, wood pressed, cold pressed, oil extraction, export of mustard powder, whole grain mustards.

The Indian Government utilises Minimum Support Prices (MSPs) and procurement schemes such as National Agricultural Cooperative Marketing Federation of India Ltd (NAFED) to support farmers during peak harvest times.

Production

Figure 1: Production of Mustard seeds in India, 2021/22 – 2024/25

The figure 1 illustrates the production of mustard seeds in India from 2021–22 to 2024–25 (in thousand tons). It shows a steady increase in production for three consecutive years, followed by a slight decline in the final year.

In 2021–22, the production of mustard seeds was recorded at 11,963.09 thousand tons. This increased to 12,643.20 thousand tons in 2022–23, reflecting a healthy growth in production. The increasing trend continued in 2023–24, when production reached its highest level of 13,259.14 thousand tons during the period under review. This growth indicates improved

productivity and the increasing importance of mustard as a major oilseed crop in India.

In 2024–25, the production slightly decreased to 12,667.11 thousand tons. Despite this marginal drop compared to the previous year, the production level remained higher than that of 2021–22, showing overall stability in mustard production.

Overall, the diagram indicates that mustard seed production in India has shown a positive growth trend with minor fluctuations, highlighting its significant role in the country's oilseed sector and agricultural economy.

Figure 2: Top 5 States Production of Mustard seeds in India, 2021/22 – 2024/25

The figure 2 presents the production of mustard seeds by the top five producing states of India from 2021–22 to 2024–25 (in thousand tons). The states included are Rajasthan, Uttar Pradesh, Haryana, Madhya Pradesh and West Bengal. The data shows Rajasthan consistently leading mustard production, while other states show fluctuating trends.

Rajasthan remains the largest producer of mustard seeds throughout the period. Production was 5776.23 thousand tons in 2021–22, which slightly increased to 5832.47 thousand tons in 2022–23. It remained relatively stable at 5758.21 thousand tons in 2023–24, before declining to 5420.57 thousand tons in 2024–25. Despite the recent decrease, Rajasthan continues to dominate mustard production in India.

Uttar Pradesh shows a steady and significant growth trend. Production increased from 1032.84 thousand tons in 2021–22 to 1620.35 thousand tons in 2022–23, further rising to 1916.24 thousand tons in 2023–24, and reaching 2409.18 thousand tons in 2024–25. This indicates strong expansion in mustard cultivation in the state.

Haryana shows moderate fluctuations. Production was

1365.83 thousand tons in 2021–22, slightly decreased to 1301.50 thousand tons in 2022–23, then increased to 1344.95 thousand tons in 2023–24, and further to 1434.49 thousand tons in 2024–25, showing overall stability with gradual improvement.

Madhya Pradesh shows a mixed trend. Production declined from 1690.65 thousand tons in 2021–22 to 1550.63 thousand tons in 2022–23, then increased significantly to 1962.45 thousand tons in 2023–24, before dropping sharply to 1107.84 thousand tons in 2024–25. This indicates some production volatility in the state.

West Bengal shows relatively stable production with minor fluctuations. Production increased from 743.39 thousand tons in 2021–22 to 816.36 thousand tons in 2022–23, slightly declined to 787.32 thousand tons in 2023–24, and again marginally increased to 796.03 thousand tons in 2024–25.

Overall, the diagram highlights that Rajasthan remains the dominant mustard producing state, while Uttar Pradesh is showing the fastest growth. Other states like Haryana and West Bengal show stable trends, while Madhya Pradesh shows some fluctuations during the period.

Trade

Figure 3: Mustard Seeds Exports (HS Code 120750)

The figure 3 shows the global export destinations of Indian mustard seeds (HS Code 120750) for the period April–March 2025. The map highlights countries importing mustard seeds from India, with darker shades indicating higher export values and lighter shades representing smaller export volumes.

The map indicates that Nepal is the largest importer of mustard seeds from India, as shown by the darkest shade on the map. This reflects strong regional trade relations and the geographical advantage India enjoys in supplying agricultural commodities to neighbouring countries. Other countries across Asia, Europe, Africa and North America are also shown as importers, although with comparatively smaller volumes.

Countries such as the United States, United Arab Emirates, Bangladesh and some European nations also form part of India's export basket. The widespread distribution of export destinations highlights the global demand for Indian mustard seeds, particularly in markets with significant Indian diaspora and food processing industries.

Overall, the map demonstrates that India's mustard seed exports are geographically diversified, with a strong concentration in neighbouring Asian countries and a growing presence in international markets. This reflects the export potential of mustard seeds and India's role as an important supplier in the global oilseed and spice trade.

Table 1: Regional and Country-wise Export of Mustard Seeds

India's mustard seed exports (HS Code 120750) showed an overall decline during April–March 2024–25, with total exports falling from 31,985.64 MT in 2023–24 to 25,294.89 MT in 2024–25, registering a decline of 20.92%. Despite the overall drop, some regions and countries showed positive growth, indicating emerging market opportunities.

Region-wise, Asia remained the largest export destination, although exports declined by 19%, mainly due to lower

shipments to other Asian countries. Nepal continued to be the top importer, with imports of 15,448.32 MT, though slightly lower than the previous year. Meanwhile, Sri Lanka showed a growth of 17%, reflecting stable demand in the region.

Exports to Africa declined sharply by 56%, mainly due to reduced exports to countries like Morocco and Senegal. However, some countries such as Mauritius (98% growth) and Kenya (24% growth) showed positive trends, indicating selective demand growth within the region.

In Europe, exports declined by 22%, with the United Kingdom, Netherlands and Germany showing lower imports. However, exports to Russia increased by 15%, showing potential market stability in Eastern Europe.

North America showed a marginal decline of 7%, with the USA remaining a stable market with almost unchanged import volumes. Canada recorded a slight decrease of 11%.

The Oceania region showed positive growth of 5%, with New Zealand registering a notable increase of 33%, while Australia remained a steady market.

A significant growth was observed in South America, where exports increased by 282%, although from a smaller base. Countries like Brazil and Argentina showed strong growth, indicating emerging opportunities for Indian mustard seeds in this region.

Overall, while India's mustard seed exports declined during the year, the data indicates market diversification and new growth opportunities in South America and Oceania, while Asia continues to remain the dominant export market.

Export trends of Mustard seeds to major destinations (april 2025-January 2026)

Figure 4: Top 5 Countries Importing Mustard Seeds from India

The figure 4 presents the top five importing countries of Indian mustard seeds and their growth trends between

April-January 2025 and April-January 2026. It compares export quantities (in tons) and the percentage growth for major markets including Nepal, Sri Lanka, UAE, USA and Saudi Arabia.

Nepal remained the largest importer of Indian mustard seeds during the period. Exports increased significantly from 10,774.21 tons in Apr-Jan 2025 to 15,213.49 tons in Apr-Jan 2026, registering a strong growth of 41.20%. This highlights Nepal's continued dependence on India for mustard seed supplies due to proximity and strong trade relations.

Sri Lanka also showed positive growth, with exports increasing from 1,948.82 tons to 2,195.91 tons, reflecting a growth of 12.68%. This indicates steady demand for Indian mustard seeds in the Sri Lankan market.

The United Arab Emirates (UAE) recorded one of the highest growth rates among the top markets. Exports increased from 1,069.53 tons to 1,564.70 tons, showing a strong growth of 46.30%, which reflects growing demand from the food processing and re-export sectors.

In contrast, exports to the United States declined from 1,194.42 tons to 957.94 tons, showing a negative growth of 19.80%. This suggests a temporary slowdown in demand or changing sourcing patterns.

Saudi Arabia showed strong recovery with exports increasing from 319.24 tons to 451.10 tons, registering a growth of 41.30%, indicating improving market demand.

Overall, the diagram shows that Nepal continues to dominate as the top export destination, while UAE and Saudi Arabia are emerging as fast-growing markets. Despite the decline in exports to the USA, the overall trend among major destinations shows positive growth and strengthening trade opportunities for Indian mustard seeds.

Global Production Scenario

Mustard seeds are primarily cultivated in temperate regions across Asia, North America, and parts of Europe. The leading producers of mustard seeds include India, Canada, China, Russia, Ukraine, and Nepal. Among these, India remains one of the largest producers due to its vast cultivation area and strong domestic demand, while Canada continues to dominate the global export market, especially for yellow mustard varieties used in sauces and condiments.

India's mustard production is largely concentrated in the northern and north-western states such as Rajasthan, Uttar Pradesh, Haryana, and Madhya Pradesh. Favorable climatic conditions, improved seed varieties, and government support through minimum support prices (MSP) have helped maintain stable production levels. Canada, on the other hand, benefits from large-scale mechanized farming and strong export infrastructure, allowing it to remain competitive in international markets.

Global Trade Dynamics

The international trade of mustard seeds is shaped by demand from food manufacturers, spice processors, and edible oil industries. The United States, European Union countries, and parts of Asia are among the major importers of mustard seeds for processing into sauces, dressings, and other value-added food products.

Trade patterns indicate that regional proximity plays an important role in export flows. For instance, India exports significant quantities to neighboring countries such as Nepal, Bangladesh, Sri Lanka, and the United Arab Emirates. Similarly, Canada exports mainly to the United States and European countries.

In recent years, global trade has also been influenced by factors such as freight costs, geopolitical developments, and climate-related production fluctuations. Despite these challenges, mustard continues to maintain stable trade volumes due to its essential role in the global food industry.

Emerging Market Trends

Several important trends are shaping the global mustard market during 2025–2026. One of the key drivers is the growing consumer preference for natural and traditional food products. Mustard oil, which was once limited to certain regions, is now gaining popularity due to its perceived health benefits and use in ethnic cuisines.

The demand for organic and cold-pressed mustard oil is also increasing, particularly among health-conscious consumers. This has encouraged farmers and processors to explore organic certification and sustainable farming practices to capture premium market segments.

Another notable trend is the increasing focus on value addition. Instead of exporting only raw seeds, many countries are now promoting processed products such as mustard paste, sauces, flavored oils, and ready-to-use spice blends. This shift is helping exporters achieve better price realization and expand their presence in retail markets.

Health and Nutritional Drivers

The nutritional profile of mustard seeds is another factor supporting their global demand. Mustard seeds are known to be rich in essential minerals such as calcium, magnesium, potassium, and phosphorus. They also contain antioxidants and beneficial plant compounds that support overall health.

Mustard oil, in particular, is gaining renewed attention due to its balanced fatty acid profile and traditional medicinal

uses. In many Asian countries, it has been used not only for cooking but also for therapeutic purposes such as massage and seasonal health practices.

As consumers increasingly move toward plant-based diets and functional foods, mustard is finding new applications in health-oriented food products. This trend is expected to support long-term demand growth in both developed and developing markets.

Challenges in the Global Mustard Market

Despite positive growth prospects, the global mustard market also faces certain challenges. Climate variability remains a major concern, as mustard crops are sensitive to temperature fluctuations and unseasonal rainfall. Any adverse weather conditions can impact yield and quality, thereby affecting global supply.

Price volatility in the broader edible oil market is another influencing factor. Since mustard oil competes with other vegetable oils such as soybean, sunflower, and palm oil, price changes in these commodities can influence mustard demand and trade flows.

Additionally, quality standards and pesticide residue regulations in international markets require exporters to maintain strict compliance. This has increased the importance of traceability, quality certification, and good agricultural practices.

Opportunities for Growth

Despite these challenges, the mustard sector offers significant growth opportunities. Increasing demand for ethnic foods in global markets has created new export avenues for mustard seeds and mustard-based products. Countries with strong diaspora populations often serve as entry points for expanding mustard consumption.

Technological improvements in seed varieties, irrigation practices, and post-harvest management are also expected to improve productivity. Hybrid seed development and better crop management practices can further strengthen production stability.

The expansion of e-commerce and organized retail is another opportunity area. Packaged mustard products such as gourmet sauces, organic oils, and specialty condiments are increasingly being marketed through online platforms, enabling exporters to reach new customer segments.

Market Outlook 2025–2026

The outlook for the global mustard market during 2025–2026 remains positive, with stable demand expected from both traditional and emerging markets. While production may witness minor fluctuations due to climatic conditions, long-term demand fundamentals remain strong.

Asia is expected to continue as the largest consumption region, while North America and Europe will remain important markets for processed mustard products. South America and Oceania are also emerging as smaller but promising markets for export diversification.

Overall, the global mustard market is expected to benefit from increasing awareness of traditional oilseeds, growing demand for natural food ingredients, and expansion in value-added product segments. Countries that focus on quality improvement, processing capabilities, and market diversification are likely to gain a competitive advantage in the coming years.

Conclusion

Mustard seeds, often regarded as a small but powerful agricultural commodity, continue to play a significant role in the global food and oilseed economy. With rising health awareness, expanding food industries, and increasing trade opportunities, the global mustard market is poised for steady growth.

As the market evolves, the focus will increasingly shift toward sustainability, value addition, and quality compliance. With the right balance of production efficiency and market development, mustard is expected to remain an important contributor to the global agricultural trade landscape in the years ahead.

MEMBERSHIP RENEWAL

NOTICE 2026-27

Your journey with us continues....

Membership Renewal for 2026-27 is now open!
Join us for another year of collaboration & growth!

Membership Categories

Ordinary Member
₹17,700/-

Associate Member
₹11,800/-

Renew within the due date for uninterrupted access to:

Industry Updates

Networking Opportunities

Member-Only Benefits

For Renewal Assistance:  sakshirane@iopepc.org  **+91 7506187428**

Secure your membership today and stay connected with the industry leaders!

K E Enterprises Deen Bandhu Oil Mills Pvt.Ltd.

K E ENTERPRISES a leading Manufacturer & Exporter of Sesame Seeds & Sesame Oil from Kolkata, India. We are Govt. recognized one Star Export House and come a long way to establish itself as one of the leader in the Path of manufacturing that meets the Quality & Standard of International Oil Markets. Our team is continuously working to explore the new food technologies and innovations to fulfill the global food standard and a healthier consumption process. Our Oil Plant DEEN BANDHU OIL MILLS PVT. LTD. is certified with BRCGS and strictly follows the Quality standards.

Our Vision & Mission is to form mutual beneficial partnerships with diverse businesses that allow us to deliver the superior Quality products & services which ultimately increase our company's brand value.

We can compromise anything for maintaining the Quality and standards but cannot compromise Quality & standard for anything. So that we can proudly announce that we are the only organization from Eastern India that achieved to Control MOSH/POSH/MOAH as per food guidelines. We guarantee MOSH/POSH <10 & MOAH <2 in all of our Sesame Oils.

TINY BUT MIGHTY

A mustard seed may be tiny enough to sit on your fingertip, but don't let its size fool you! Given the right conditions, this little seed can grow into a tall mustard plant reaching **up to six feet high**-sometimes taller than the person who planted it!

In just a few months, what starts as a speck turns into a strong plant filled with bright yellow flowers and thousands of new seeds. It's almost like nature's magic trick - **from dot to giant**.

Farmers love mustard not just for its oil and seeds, but also because it grows quickly and stands strong. One small seed can create a whole new generation of plants.

Next time you see mustard seeds popping in hot oil in your kitchen, just remember - each one has the potential to become a tall plant in a field somewhere.

Proof that even the smallest things can have the biggest potential!
